To whom it may concern

Romold Spill Containment Products are fluid tested during development to determine sump capacity and a leak test is carried out on the initial production run, thereafter products are visually inspected before dispatch.

Romold Products including the TT64 and TT100 comply with European Community Country (ECC) regulations relating to Spill Containment.

These regulations specifically state that bunds must be able to contain 25% of the total volume of liquid stored in multiple containers or 110% of the total volume of liquid stored in a single container, whichever is greater.

Standards used in America known as the Environmental Protection Agency (EPA) regulations also state the same percentages as do the Spill Prevention Control & Countermeasures (SPCC) guidance notes.

All these regulations and guidance notes apply to plastic, steel and brick built bunds.

Yours faithfully

Romold Ltd
